located on the sides of certain buildings, usually a church or university. The bench mark was a metal ball imbedded in concrete. These points were located and numbered on the plans of the city which could be obtained from the burgermeister. If you wanted to use one of these bench marks, you had to go to NKVD headquarters and tell them the number of the bench mark in which you were interested. They would then investigate why you wanted to know and if you had the authority to have this information. If you passed the investigation they would tell you the latitude, longitude and elevation of the marks in question. In the country, the bench marks were square wooden posts, about 8" on a side, about one meter in the ground, and about 30 cm above the ground. There was a crosspiece on the bottom to make it more stable. Each bench mark had a number which had to be given to the NKVD to obtain the necessary data for its use.

FRONT VIEW

The limits of error depended upon the class of terrain, of which there were five. Fifth class terrain was ideal; first class was very rugged. surveying was done in what was considered fourth class terrain. The allowable error was ± one in 2,000. In fifth class terrain, the allowable error was ± one in 15-20,000.

7. The only maps were of villages or surrounding countryside. These were kept in the burgermeister's office. The maps of villages were generally 1:500 and of the countryside, 1:2,500. They did not contain elevations. There were no security regulations regarding these maps. Maps showing military installations, buildings and railroads could only be obtained from the NKVD. Ordinary road maps could be purchased anywhere.
